

Wireless IP Camera Operation Guide

First of all, the cellphone should keep in the state of surfing the internet (WIFI/3G), support above ios4.3 / Android2.2.

1. Install the software on cellphone.

Android mobile phone could search and download the “K10” in Google play. Or use UC browser to scan the QR code outside the package box, download and install it.

Apple mobile phone could enter the IOS APP Store, search “K10”, download or scan the QR code and install it. After download, open the installation program, and then install it.

2. Register Account

K10 support register with email address. Open the software, click “register”, input the email address and set a password, and then click “register”.

3. Add and delete the device

The device should be connected with the network line and plug in. If the cellphone's wifi network is same as the device, pls open the tools and click “shake”, it will refresh the new device automatically. Choose one device and enter the interface of device account setting, set the name of device and a new administrative password, click “save” in the top right corner. Add device and set the device password successfully. The device account can also be added through the local area network or manually.

choose one device account, long press the icon in the middle, will pop-up a window, click delete, then delete the device successfully.

Note: Before delete device, it need to set the alarm push ID, click it into the alarm push ID interface and delete the device account, otherwise once trigger the device, it will still push alarm to the phone.

.1.

4. Function operate

1. Browse the video: at the device list interface, click the left icon of device, into to the interface of video browsing. **The device with PTZ function can turn the direction of video by sliding the screen.**
